

***Cercopithecus aethiops* Kidney Epithelial Cells with Human Signaling Lymphocytic Activation Molecule (Vero-hSLAM)**

**Catalog No. NR-55500**

**For research use only. Not for use in humans.**

**Contributor:**

Bryan J. Bolton, Ph.D., Head of Department, Culture Collections, Public Health England, through Sigma-Aldrich, St. Louis, Missouri, USA

**Manufacturer:**

BEI Resources

**Product Description:**

NR-55500 Vero-hSLAM is a cell culture suspension of *Cercopithecus aethiops* kidney epithelial cells which were modified to express Human Signaling Lymphocytic Activation Molecule.<sup>1</sup>

Observations of working stocks of SARS-CoV-2 suggest that sequential propagation in Vero cells leads to critical changes in the region of the furin cleavage site (FCS). Global studies conducted at four institutions conclude that serial propagation of SARS-CoV-2 in Vero-hSLAM cells reduces the apparent rate of mutant production in stocks. Propagation in Vero-hSLAM appears to minimize mutations and improve the overall genetic stability of working stocks, as illustrated by Illumina deep sequencing of four sequential batches of stocks derived from an early clinical isolate propagated in Vero-hSLAM cells which found no detectable FCS deletions.<sup>2</sup>

**Material Provided:**

Each vial contains approximately 1 mL of cell culture suspension frozen in Earle's Modified Eagle's Medium containing 10% fetal bovine serum and 0.4 milligrams per milliliter geneticin and DMSO (10%) cryopreservative. Sufficient cells are provided to initiate at least one new culture. The cell count, expressed as cells per vial, is shown on individual Certificates of Analysis for each lot.

**Packaging/Storage:**

This product was packaged aseptically, in screw-capped plastic cryovials. It should be stored at -100°C or colder, preferably in the vapor phase of a liquid nitrogen freezer. Storage at -70°C will result in loss of viability. To ensure the highest level of viability, the vial should be thawed and the culture initiated as soon as possible upon receipt. Any warming of the product during shipping and transfer must be avoided, as this will adversely affect the viability of the product after thawing. For transfer between freezers and shipping, the cells may be placed on dry ice for brief periods, although use of a portable liquid nitrogen carrier is preferred. Please read the following recommendations prior to reconstituting this material.

**Safety Precautions:**

When handling frozen vials, it is highly recommended that protective gloves, lab coat and full-face mask be worn. Even brief exposure to the ultra-cold temperature can cause tissue damage from frostbite. Also, some vials may slowly fill with liquid nitrogen if they have been immersed during cryogenic storage. When thawing, the liquid nitrogen may rapidly expand as it changes to gas, breaking the vial or cap with explosive force, sending debris flying with enough velocity to cause injury. Store and use in areas with adequate ventilation.

**Thawing and Growth:**

Prior to thawing the Vero-hSLAM cells, prepare growth medium (GM) for use. Vero-hSLAM cells are grown in Earle's Modified Eagle's Medium, supplemented with 10% fetal bovine serum (ATCC® 30-2020™) and 0.4 micrograms per milliliter geneticin. This GM is formulated for use with a 5% CO<sub>2</sub> in air atmosphere.

Rapidly thaw the vial of cells in a 37°C water bath with gentle agitation. To reduce the risk of contamination, keep the cap and O-ring of the vial out of the water and repeatedly check the cap for tightness during thawing. Remove from the water bath immediately, when thawed. Dry the vial with a sterile wiper, decontaminate using a wiper soaked with 70% isopropyl alcohol and let the vial air dry. Aseptically open the vial, remove the vial contents and add to 4 mL of GM in a centrifuge tube. Centrifuge the cell suspension at 125 to 200 × g for 8 to 10 minutes at 18 to 25°C. Discard the supernatant and resuspend the cell pellet in 10 mL of pre-warmed GM. Transfer the cell suspension into a 75 cm<sup>2</sup> tissue culture flask. Incubate the new culture at 37°C and 5% CO<sub>2</sub>. Replace the GM with fresh GM every 2 to 3 days and incubate until the cell sheet is approximately 80% confluent.

Sub-culture procedure. Aseptically remove the GM and discard. Briefly rinse the cell layer with 4 to 15 mL of Ca<sup>2+</sup>- and Mg<sup>2+</sup>-free Dulbecco's phosphate-buffered saline (PBS) to remove all traces of serum. Discard the PBS. Add 2 to 8 mL of 0.05% trypsin-EDTA to the culture flask and incubate the flask at 37°C until the cell layer is dispersed (usually within 3 minutes but no longer than 15 minutes). *Note: To avoid clumping, do not agitate the cells by hitting or shaking the flask.* Add an equal volume of GM and aspirate cells by gently pipetting. Perform a cell count and add appropriate aliquots of the cell suspension to new culture vessels at a sub-cultivation ratio of 1:3 to 1:4. Adjust the volume of GM to 15 to 20 mL for a 75 cm<sup>2</sup> flask. Incubate cultures at 37°C and 5% CO<sub>2</sub>. Replace the GM with fresh GM every 2 to 3 days and incubate until the cell sheet is approximately 80% confluent.
